**The Matter of the Heart**-Thomas Morris

2018-01-16 An eye-opening and heroic story of pioneering heart surgeons, structured around eleven operations. For thousands of years the human heart remained the deepest of mysteries; both home to the soul and an organ too complex to touch, let alone operate on. Then, in the late nineteenth century, medics began going where no one had dared go before. The following decades saw the mysteries of the heart exposed, thanks to pioneering surgeons, brave patients and even sacrificial dogs. In eleven landmark operations, Thomas Morris tells us stories of triumph, reckless bravery, swaggering arrogance, jealousy and rivalry, and incredible ingenuity: the trail-blazing 'blue baby' procedure that transformed wheezing infants into pink, healthy children; the first human heart transplant, which made headline news around the globe. And yet the heart still feels sacred: just before the operation to fit one of the first artificial hearts, the patient's wife asked the surgeon if he would still be able to love her. The

Matter of the Heart gives us a view over the surgeon's shoulder, showing us the heart's inner workings and failings. It describes both a human story and a history of risk-taking that has ultimately saved millions of lives.

**Global Climate Change Demystified**-James G. Speight 2019-12-17 For too many years climate change (also referred to as global warming) has been assigned predominantly to the emissions of carbon dioxide though the combustion of fossil fuels. It must never be forgotten or ignored, however, that the Earth is constantly changing since its formation and has gone through different eras like glaciations, among others. These changes need thousands of years to be made visible, and the current increase in the average temperature of the Earth since the pre-industrial period is happening, provided that the measurements of past climatic temperatures are accurate and beyond reproach. Thus, the assessment that the warming trend that has occurred over the past 100 years is very likely to have some origins in natural events. The precise contributions of natural effects and

anthropogenic effects on the climate are not known, but it is accurate to conclude that many factors continue to influence climate. Whether or not human activities have become a dominant force in the changing climate and are responsible for most of the warming observed is still open to question. When studying the climate system of the Earth, an area of common confusion that relates to whether climate scientists agree or disagree as to whether or not climate change is happening, or if it is happening, whether or not humans are the primary cause. There are a variety of reasons for this, but a majority of scientists who study climate and publish in peer-reviewed journals agree that human activity is causing the warming of the Earth. The purpose of this book is to weigh all of these various data points and, in a scientific and unemotional way, arrive at likely conclusions regarding global climate change. Whether human activity is the main driver behind our current changes in climate, one thing is certain: Climate change is happening, and we all need to make informed, rather than emotional, decisions.
