Laragh's Lessons in Renin System Pathophysiology for Treating Hypertension and Its Fatal Cardiovascular Consequences-

John H. Laragh 2002 Here's an essential reference for anyone needing an advanced understanding of the nature and treatment of hypertension. Dr. Laragh, a pioneering clinician and scientist, demonstrates the central role of an overactive renin system for causing most hypertension. In his new book, Dr. Laragh discusses his research and its relevance to caring for everything from asymptomatic patients to hypertensive emergencies. And, he provides visit-by-visit details of his new pathophysiologically and biochemically guided treatment. The result of his work is a specific approach that makes it possible to more effectively prevent, arrest, and treat hypertension and its consequences--including congestive heart failure, myocardial infarction, kidney failure and stroke. Defined three anti-renin R drug classes: beta blockers

intravenous converting enzyme inhibitors and angiotensin receptor blockers, and showed the direct correlations between the depressor effectiveness of each of these drugs and the height of baseline rennin levels of each patient. Originated the strategy of using plasma renin testing to determine whether the sodium volume V mediates a patient's hypertension or the rennin vasoconstriction R factor in order to prescribe the appropriate V or R drug treatment.

Kidney and Blood Pressure Regulation- Hiromichi Suzuki (M.D.) 2004 Chronic kidney

disease is one of the world's major public health problems, and the prevalence of kidney failure is rising steadily. Among the risk factors for a faster progression of renal disease are hypertension and proteinuria, many studies clearly demonstrating that hypertension is both a cause and consequence of chronic kidney disease. Namely, renal blood pressure regulation seems to be involved in five major pathophysiological mechanisms (all closely related to the renin-angiotensin system): Pressure-natriuresis, renal sympathetic nervous system, renal blood flow, intraglomerular pressure and tubuloglomerular feedback. This book reviews experimental data which form the basis of our current understanding of the association between hypertension and kidney diseases: The pathogenesis of increased blood pressure, the mechanisms by which systemic hypertension promotes progressive kidney failure, and the impact of antihypertensive agents on experimental renal mechanisms involved in hypertension. Furthermore, the role of angiotensin II receptor blockers in both the

control of systemic blood pressure and the reduction of proteinuria is examined in an attempt to define optimal therapeutic strategies to prevent the otherwise inexorable deterioration of renal function in patients with chronic kidney disease.

Cardiovascular Pathophysiology-Gail G.

Ahumada 1987 Written by a distinguished group of physicians and scientists, this volume provides a thorough survey of the basic mechanisms of cardiovascular disease. Each chapter begins with a brief overview of normal structure and function, and then offers a clear discussion of pathophysiologic mechanisms, covering both acquired and congenital abnormalities. Physical examination of the cardiovascular system, invasive and noninvasive diagnostic methods, and medical and surgical treatment are discussed in terms of their relation to pathophysiology, so that clinical practice is seen to proceed logically from the nature of the underlying disease process. The book is intended

for students of medicine with a background in normal cardiovascular physiology who are ready to learn about important abnormalities of the system. It will enable them to understand appropriate approaches to patients with cardiovascular disease, as well as to comprehend the immense detail available in more comprehensive texts. As a concise account of the anatomic, physiologic, and pathologic basis of clinical cardiology, the book will continue to be valued in later years by those requiring a review of major pathophysiologic mechanisms.

The Renin-Angiotensin System and the

Kidney-Xiao C. Li 2015-03-01 The renin-angiotensin system (RAS) is one of the most important endocrine (tissue-to-tissue), paracrine (cell-to-cell) and intracrine (intracellular/nuclear) humoral systems in the regulation of blood pressure, cardiovascular, and kidney function in health and disease. The RAS has remarkably evolved from the initial discovery of the rate-limiting enzyme renin to a complex biochemical and physiological cascade involving more than a dozen members. Currently, there are up to five

axes or pathways identified in the RAS; each has its substrate, enzyme, effector peptide, receptor, and downstream signaling pathways. These include the renin/ACE/ANG II/AT1 receptor, the APA/ANG III/AT2 receptor, the ACE2/ANG (1-7)/Mas receptor, the prorenin/prorenin receptor (PRR), and the ANG IV/AT4 receptor (IRAP) pathways. Accordingly, the roles of the RAS have expanded well beyond the classic endocrine paradigm as a powerful vasoconstrictor, a potent aldosterone stimulator, or a sodium-retaining hormonal system. The goals of this article are to review and discuss the current insights into and new perspectives on the expression, localization, and novel actions of the RAS with a focus in the kidney. Special emphasis will be placed on recently discovered new members of the RAS derived from studies using innovative mutant rats or mice that either overexpress (knockin) or are deficient (knockout) of a particular substrate, enzyme, ANG peptide, or receptor. This new knowledge will help improve our understanding how each of these pathways act directly or indirectly to regulate

blood pressure, cardiovascular and kidney function in physiology, and can be targeted to treat hypertension, cardiovascular and renal diseases.

Sodium Intake in Populations-Institute of Medicine 2013-08-27 Despite efforts over the past several decades to reduce sodium intake in the United States, adults still consume an average of 3,400 mg of sodium every day. A

number of scientific bodies and professional health organizations, including the American Heart Association, the American Medical Association, and the American Public Health Association, support reducing dietary sodium intake. These organizations support a common goal to reduce daily sodium intake to less than 2,300 milligrams and further reduce intake to 1,500 mg among persons who are 51 years of age and older and those of any age who are African-American or have hypertension, diabetes, or chronic kidney disease. A substantial body of evidence supports these efforts to reduce sodium intake. This evidence links excessive dietary sodium to high blood pressure, a surrogate marker for cardiovascular disease (CVD), stroke, and cardiac-related mortality. However, concerns have been raised that a low sodium intake may adversely affect certain risk factors, including blood lipids and insulin resistance, and thus potentially increase risk of heart disease and stroke. In fact, several recent reports have challenged sodium reduction in the population as a strategy to reduce this risk. Sodium Intake in

Populations recognizes the limitations of the available evidence, and explains that there is no consistent evidence to support an association between sodium intake and either a beneficial or adverse effect on most direct health outcomes other than some CVD outcomes (including stroke and CVD mortality) and all-cause mortality. Some evidence suggested that decreasing sodium intake could possibly reduce the risk of gastric cancer. However, the evidence was too limited to conclude the converse—that higher sodium intake could possibly increase the risk of gastric cancer. Interpreting these findings was particularly challenging because most studies were conducted outside the United States in populations consuming much higher levels of sodium than those consumed in this country. Sodium Intake in Populations is a summary of the findings and conclusions on evidence for associations between sodium intake and risk of CVD-related events and mortality.

The Cardiologist's Painless Prescription for a Healthy Heart and a Longer Life-Joe D. Goldstrich 1994

Stress and Cardiovascular Disease-Paul Hjemdahl 2011-10-01 The main aim of this book is to evaluate the concept of stress and provide tools for physicians to identify patients who might benefit from stress management. This will incorporate a detailed description of the physiological and pathophysiological consequences of acute and chronic stress that might lead to cardiovascular disease. The book will aim to critically evaluate interventional research (behavioural and other therapies) and provide evidence based recommendations on how to manage stress in the cardiovascular patient. Our intentions are to define and highlight stress as an etiological factor for cardiovascular disease, and to describe an evidence based "tool

box" that physicians may use to identify and manage patients in whom stress may be an important contributing factor for their disease and their risk of suffering cardiovascular complications.

Endocrine Frailty in the Elderly-Sandro La Vignera 2019-12-04

Basic Sciences for MCEM-Chetan Trivedy 2016-05-15 This book is a dedicated resource for those sitting the Part A of the MCEM (Membership of the College of Emergency Medicine) examination. It forms an essential revision guide for emergency trainees who need to acquire a broad understanding of the basic sciences, which underpin their approach to clinical problems in the emergency department. Common clinical scenarios are used to highlight the essential underlying basic science principles, providing a link between clinical management and a knowledge of the underlying anatomical,

physiological, pathological and biochemical processes. Multiple choice questions with reasoned answers are used to confirm the candidates understanding and for self testing. Unlike other recent revision books which provide MCQ questions with extended answers, this book uses clinical cases linked to the most recent basic science aspects of the CEM syllabus to provide a book that not only serves as a useful revision resource for the Part A component of the MCEM examination, but also a unique way of understanding the processes underlying common clinical cases seen every day in the emergency department. This book is essential for trainees sitting the Part A of the MCEM exam and for clinicians and medical students who need to refresh their knowledge of basic sciences relevant to the management of clinical emergencies.

Prehypertension and Cardiometabolic

Syndrome-Reuven Zimlichman 2018-12-06 This book sheds new light on the management of patients with borderline cardiovascular risk factors in order to prevent their progression to end organ damage. The book stimulates discussion of this poorly understood condition and lays the groundwork for developing recommendations and guidelines. While the diagnostic and therapeutic approach to full-blown diabetes, hypertension, dyslipidemia and obesity is well defined, there is still a lack of clear understanding and guidelines as far as patients with borderline conditions - especially when multiple - are concerned. Moreover, end-organ damage depends on several factors, including genetic factors, making it difficult to predict its extent. As such, the gradual transition from a healthy subject to one with functional hemodynamic changes, and then one with structurally asymptomatic changes and lastly to

overt disease needs further investigation. In order to address these knowledge gaps, the book covers a broad variety of topics, making it a valuable tool for identifying which asymptomatic subjects could profit from being appropriately screened and at what stage. Furthermore it offers insights into better treating these patients to prevent their progression to overt disease. The book appeals to cardiologists, primary care physicians and all those healthcare professional looking to optimize the management of these complex and often undiagnosed cases.
