**Soft-Tissue Lasers in Dental Hygiene**-Jessica Blayden 2013-01-09 The uses and benefits of soft-tissue lasers in dental hygiene practice are myriad. Lasers are used for more effective debridement, scaling and planning, with less pain and bleeding. Hygienists can detect sub- and supra-gingival calculus, remove the bacteria in pockets, and remove granulation, among other treatments. Soft-tissue Lasers in Dental Hygiene is the first book to explain laser use in periodontal therapy. Authors Jessica Blayden and Angie Mott are registered dental hygienists who have been using laser therapy in their dental hygiene practices for several years, and here they share their experience. Blayden and Mott begin by discussing laser history, physics,

components, and safety. They then describe the specifics of periodontal therapy—what lasers can be used for, how to implement them, techniques, and protocols. The authors also present case studies that demonstrate how treatment plans are implemented for varying levels of periodontal disease. The authors conclude with chapters on patient communication and practice management.

Dental Hygiene Considerations boxes list quick facts that can affect the client's care. Health Application boxes cover a nutritional issue relevant to each chapter (e.g., diabetes mellitus, obesity, and hypertension). Case Application boxes use example case studies to walk students through assessing, evaluating, and treating specific clinical situations. Student Readiness sections offer short answer questions, activities, and new case studies. More full-color photographs are added, helping you to identify and assess oral problems. **The Forsyth Experiment**-Ralph R. Lobene 1979  
The largest unmet health need in this country--and potentially the most costly--is for dental care; meeting this need would strain existing personnel and facilities beyond capacity. This book reports an experiment in delivering dental care by means that are not traditional but preserve the high standards that have been achieved by American dentistry. At the Forsyth Dental Center in Boston, Massachusetts, graduate dental hygienists received additional

training in the administration of local anesthesia, drilling decayed teeth, and filling them. The program was designed to prepare dental auxiliaries to undertake restorative treatment under the direct supervision of a dentist who assumes ultimate responsibility for planning treatment, assessing the quality of performance, and assuring the patient's well-being. The Forsyth experiment yielded information on the competence of auxiliaries trained in this fashion, on patient acceptance, on the efficiency of various patterns of practice, and on the potential economic effects of delivering care in this way. The results of the study are bound to stir controversy, but they cannot be ignored by anyone who cares about a major problem in health care.
