**Concepts of Biology**-Samantha Fowler 2018-01-07 Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives.

For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.

**The Class Reptilia**-Georges baron Cuvier 1831

**Reptiles and Amphibians**-Fredric L. Frye 2005-01-01 There is enormous and growing worldwide interest in reptiles and amphibians in their natural habitats and in captivity. As the number of herpetologists, and the range of their interests, increases fast, veterinary practitioners are faced by an even wider array of animals kept as pets, in collections or for research, and knowledge of reptile and amphibian medicine is thus routinely expected of them. This Self-Assessment Colour Review presents the reader with some 250 short cases in the form of colour photos and questions at different levels of expertise, plus detailed explanatory answers. The cases appear in random order, just as they would in real life, and enable the reader - by solving the clinical puzzle - to make differential diagnoses, treatment plans and prognoses. Both authors lecture internationally and Dr Frye is among the world's foremost authorities on reptile and amphibian medicine. Experienced and less experienced veterinary practitioners and students, plus professional and amateur herpetologists, find in this Colour Review a wealth of problem-oriented information of value - and enjoyment - in their formal and informal training and continuing education.

**Mediterranean Identities**-Borna Fuerst-Bjeliš 2017-11-08 What is the Mediterranean? The perception of the Mediterranean leans equally on the nature, culture, history, lifestyle, and landscape. To approach the question of identity, it seems that we have to give importance to all of these. There is no Mediterranean identity, but Mediterranean identities. Mediterranean is not about the homogeneity and uniformity, but about the unity that comes from diversities, contacts, and interconnections. The book tends to embrace the environment, society, and culture of the Mediterranean in their multiple and unique interconnections over the millennia, contributing to the better understanding of the essential human-environmental interrelations. The choice of 17 chapters of the book, written by a number of prominent scholars, clearly shows the necessity of the interdisciplinary approach to the Mediterranean identity issues. The book stresses the most serious concerns of the Mediterranean today - threats to biodiversity, risks, and hazards - mostly the increasing wildfires and finally depletion of traditional Mediterranean practices and landscapes, as constituent parts of the Mediterranean heritage.

**Micro-, Meso- and Macro-Dynamics of the**

**Brain**-György Buzsáki 2016-05-02 This book brings together leading investigators who represent various aspects of brain dynamics with the goal of presenting state-of-the-art current progress and address future developments. The individual chapters cover several fascinating facets of contemporary neuroscience from elementary computation of neurons, mesoscopic network oscillations, internally generated assembly sequences in the service of cognition, large-scale neuronal interactions within and across systems, the impact of sleep on cognition, memory, motor-sensory integration, spatial navigation, large-scale computation and consciousness. Each of these topics require appropriate levels of analyses with sufficiently high temporal and spatial resolution of neuronal activity in both local and global networks, supplemented by models and theories to explain how different levels of brain dynamics interact with each other and how the failure of such interactions results in neurologic and mental disease. While such complex questions cannot be answered exhaustively by a dozen or so chapters, this volume offers a nice synthesis of current thinking and work-in-progress on micro-, meso- and macro- dynamics of the brain.

**The Photo Ark**-Joel Sartore 2017 This lush book of photography represents National Geographic's Photo Ark, a major cross-platform initiative and lifelong project by photographer Joel Sartore to make portraits of the world's animals-especially those that are endangered. His powerful message, conveyed with humor, compassion, and art- to know these animals is to save them.Sartore intends to photograph every animal in captivity in the world. He is circling the globe, visiting zoos and wildlife rescue centers to create studio portraits of 12,000 species, with an emphasis on those facing extinction. He has photographed more than 6,000 already and now, thanks to a multi-year partnership with National Geographic, he may reach his goal. This book showcases his animal portraits- from tiny to mammoth, from the Florida grasshopper sparrow to the greater one-horned rhinoceros. Paired with the eloquent prose of veteran wildlife writer Douglas Chadwick, this book presents a thought-provoking argument for saving all the species of our planet.

**Maine Amphibians and Reptiles**-Malcolm L.

Hunter 1999 Maine Amphibians and Reptiles describes each species in prose that is substantial and authoritative, yet clear and engaging. Where does each species live? These and scores of other questions are covered in accounts for each species, along with detailed drawings showing them in their natural setting and range-maps based on the latest data from throughout the region. Tips for finding these species, conservation issues, exotic species, and other topics are covered in additional chapters. Of particular note is the enclosed compact disc, narrated and produced by well-known naturalist

Lang Elliott, that will make it easy to learn to identify all the frogs and toads by their songs. The CD also includes a long unnarrated series of frog choruses.

**Ecology of small mammals**-D.M. Stoddart 2012-12-06 From their largely descriptive beginnings about a half century ago, studies on the ecology of small mammals have mushroomed in number, scope, content and complexity. Yet strangely, or perhaps not so strangely if one considers the extent and complexity of ecological interactions, the main problems for which the early workers sought answers still defy complete analysis, and basic hypotheses remain untested if not even untestable. The same holds true for so many branches of animal ecology that it seems to be the complexity of the concepts that frustrates efforts rather than the subject species. Like all branches of science, small mammal ecology has been subject to a series of fashionable approaches, one following another as technology penetrates previously impregnable regions. Doubtless the future development of our science

will be punctuated by wave upon wave of new endeavour in whole fields that are perhaps even yet unidentified. Answers to the complex questions which ecologists ask do not come easily. Increasingly though, they arise in direct proportion to the efforts expended upon their elucidation. Many studies have achieved such a high level of elegance, in terms of manpower and apparatus, that there is a feeling that questions asked when such resources are unavailable are not worth asking. Nothing could be further from the truth. Many a complex model has failed fully to explain the phenomenon for which it was constructed because of a lack of basic field data on the species' natural history.
